

## CASE STUDY

# NORTH NORTHANTS COUNCIL ADDS PANIC ALARM SYSTEM TO YOUTH WORKS BUILDING

## PROJECT FEATURES

### Challenge:

To install a panic alarm within a building which has asbestos and minimal disruption to day to day usage of the meeting rooms

### Solution:

Installation of a hybrid panic alarm system working around asbestos. Hard wired Panic alarm solution and wireless panic alarm pendants installed to assist with users in meeting rooms. Each room has external strobe and sounder to denote which room is in alarm so security can react directly to resolve any incidents.

North Northants council reached out to Sonic Security Services Ltd an approved contractor for councils to work closely with them to design and install a new panic alarm solution for their meeting rooms.

The standout building in Kettering is connected to the newly renovated reception building. The challenge we were working with was asbestos, which is well established in old buildings. We provided a hybrid solution to overcome the issue of asbestos using leading brands CQR hard wired and Pyronix wireless panic alarm buttons. The wireless pendants can be used during meetings which will stay local with the employee when in their meeting room. On activation of either the wall mounted units or wireless pendants these will action an external strobe sounder to the room to denote which area has gone into alarm. The alarm would then be notified to security on site whom will then conduct their procedure to address the alarm.

Our installation was installed to the highest of standards taking into the clients building makeup and reduced downtime of meeting room use.
